

Integration PPS with eNothi

"eNothi" is a decision management System used in government offices to make file processing easy and save time. It provides all facilities including DAK upload, nothi jato , Nothi Nisponno , pottro jari, nothi

archiving, etc. While doing specified activities, nothi has provisions to provide status and decisions of file movement to another system integrated with it. When the integrated system sends information along with an attached document then it is received as DAK by eNothi . After then the received document puts into nothi and continues its movement according to the official rules. At the end of each movement, the connected system is notified from nothi by providing status, decision or any required document. Any correction in the note can be made at any time through resubmission with the previous note number.

As we are going to integrate PPS- Project planning System of Planning commission, PPS will avail the articulated facilities from Nothi besides its ongoing activity. A draft diagram is shown below to understand the basic workflow between these systems

Activity Diagram between PPS And eNothi
