Hiring Software Engineer - Phase 1

Case Studies **[Based on real cases]**

Imagine that you have been working in the company for some time and you have a list of the following tasks. Please explain briefly, how you would solve the problems.

[N.B: Please remember that there is no correct answer from the technical side, we just want to know your way of thinking]

Question 1 :

Our user uploads a PDF file (case study) via our system and they wait for a long while they get a response that their file was successfully uploaded.

What clarifying questions would you ask about this task and to whom?

Please, suggest why it takes so much time, and what solution(s) can be applied to decrease waiting time?

If it is not possible to reduce file Load time, what solutions will help the user stay satisfied with the system?

Question 2:

We have a table sheet in CRM with 1000 employees. The size of the The employees' page is too large, so it downloads very slowly. What clarifying questions would you ask about this task and to whom?

Please, suggest why it can take so much time, and what solution(s) can be applied to increase the downloading speed? If it is not possible to increase the downloading speed, what solutions will help the user stay satisfied with the system?

Coding Challenge :

Our development process follows Scrum/Agile methodology. We have different teams handling specific parts of the SDLC pipeline and automated tools that perform certain checks, e.g. code quality, code test coverage, code bugs, and performance.

For this to be effective and for your work to be merged upstream, please commit small, specific commits that can be flattened later, as it greatly helps with the code review process.

We are aware that you have existing obligations, so we can only commit a small amount of time to this task, so we are not expecting you to spend more than 7 hours in total.

User story	Definition
Currency exchange rate	The task is to create a Laravel package, this package will expose an API GET endpoint that will receive the following params: • amount • currency to exchange You can assume the default currency is Euro. This endpoint should return the exchange rate for the given amount in the same standard format as the other API endpoints. The package must fetch the exchange rate of the day from the European Central Bank daily reference. The package must have unit tests documentation and a readme.md file. The package must be installed with composer as a local dependency.

[N.B: European Central Bank API <https://www.ecb.europa.eu/stats/eurofxref/eurofxref-daily.xml>]

Submitting Your Code

When you are finished with your testing code, please mail to hr@skylarksoft.com with your Public Git Repository Link for Coding Challenge and Case Studies [answer] in a doc file.

Best Of Luck
